

Factory supply pet feed dry sterilization equipment

The factory supply the pet feed drying sterilization equipment is the heating material itself as the heating material itself. The roasting effect of the factory supplies the pet feed drying sterilization equipment to the inside of the material instantaneously, so that the material is heated at the same time and at the same time without heat conduction, so Wen Shengji is fast and greatly shortens the heating time. The time is usually about 1/4 of the conventional method. Baking, like other food processing, is a complex physical and chemical system that requires orderly generation and suitable time / temperature conditions. The quick heating of drying equipment for pet feed will cause breakage and overexpansion of baked products. The microwave heating speed is fast, the gas (air) temperature in the material rises sharply. Due to the slow mass transfer speed, the heated gas is in the state of high pressure, and there is a tendency of expansion, and the material will expand when the pressure is reached.
